

Interactive Color in Motion

Concept: The showcase concept for this exhibit is an installation of five large fabric canvas shade structures located at the entry plaza. These structures provide both dramatic visual interest and act as reflective surfaces to a spectacle display of interactive light. Below each canopy, embedded within a paved surface, is an array of active color changing LED light fixtures. With use of heat and motion sensors these touchable, dimmable, light fixtures automatically adjust color, brightness and display depending on activity happening within the plaza. As guests use the plaza, surface lights react based on individual actions or speed of movements (Examples: a jump could trigger a sunburst of color, walking across the surface could create ripples of light).

Alternative interactive projections can be programmed with interactive game sequences and/or programmed to interact with patrons, sound and music.

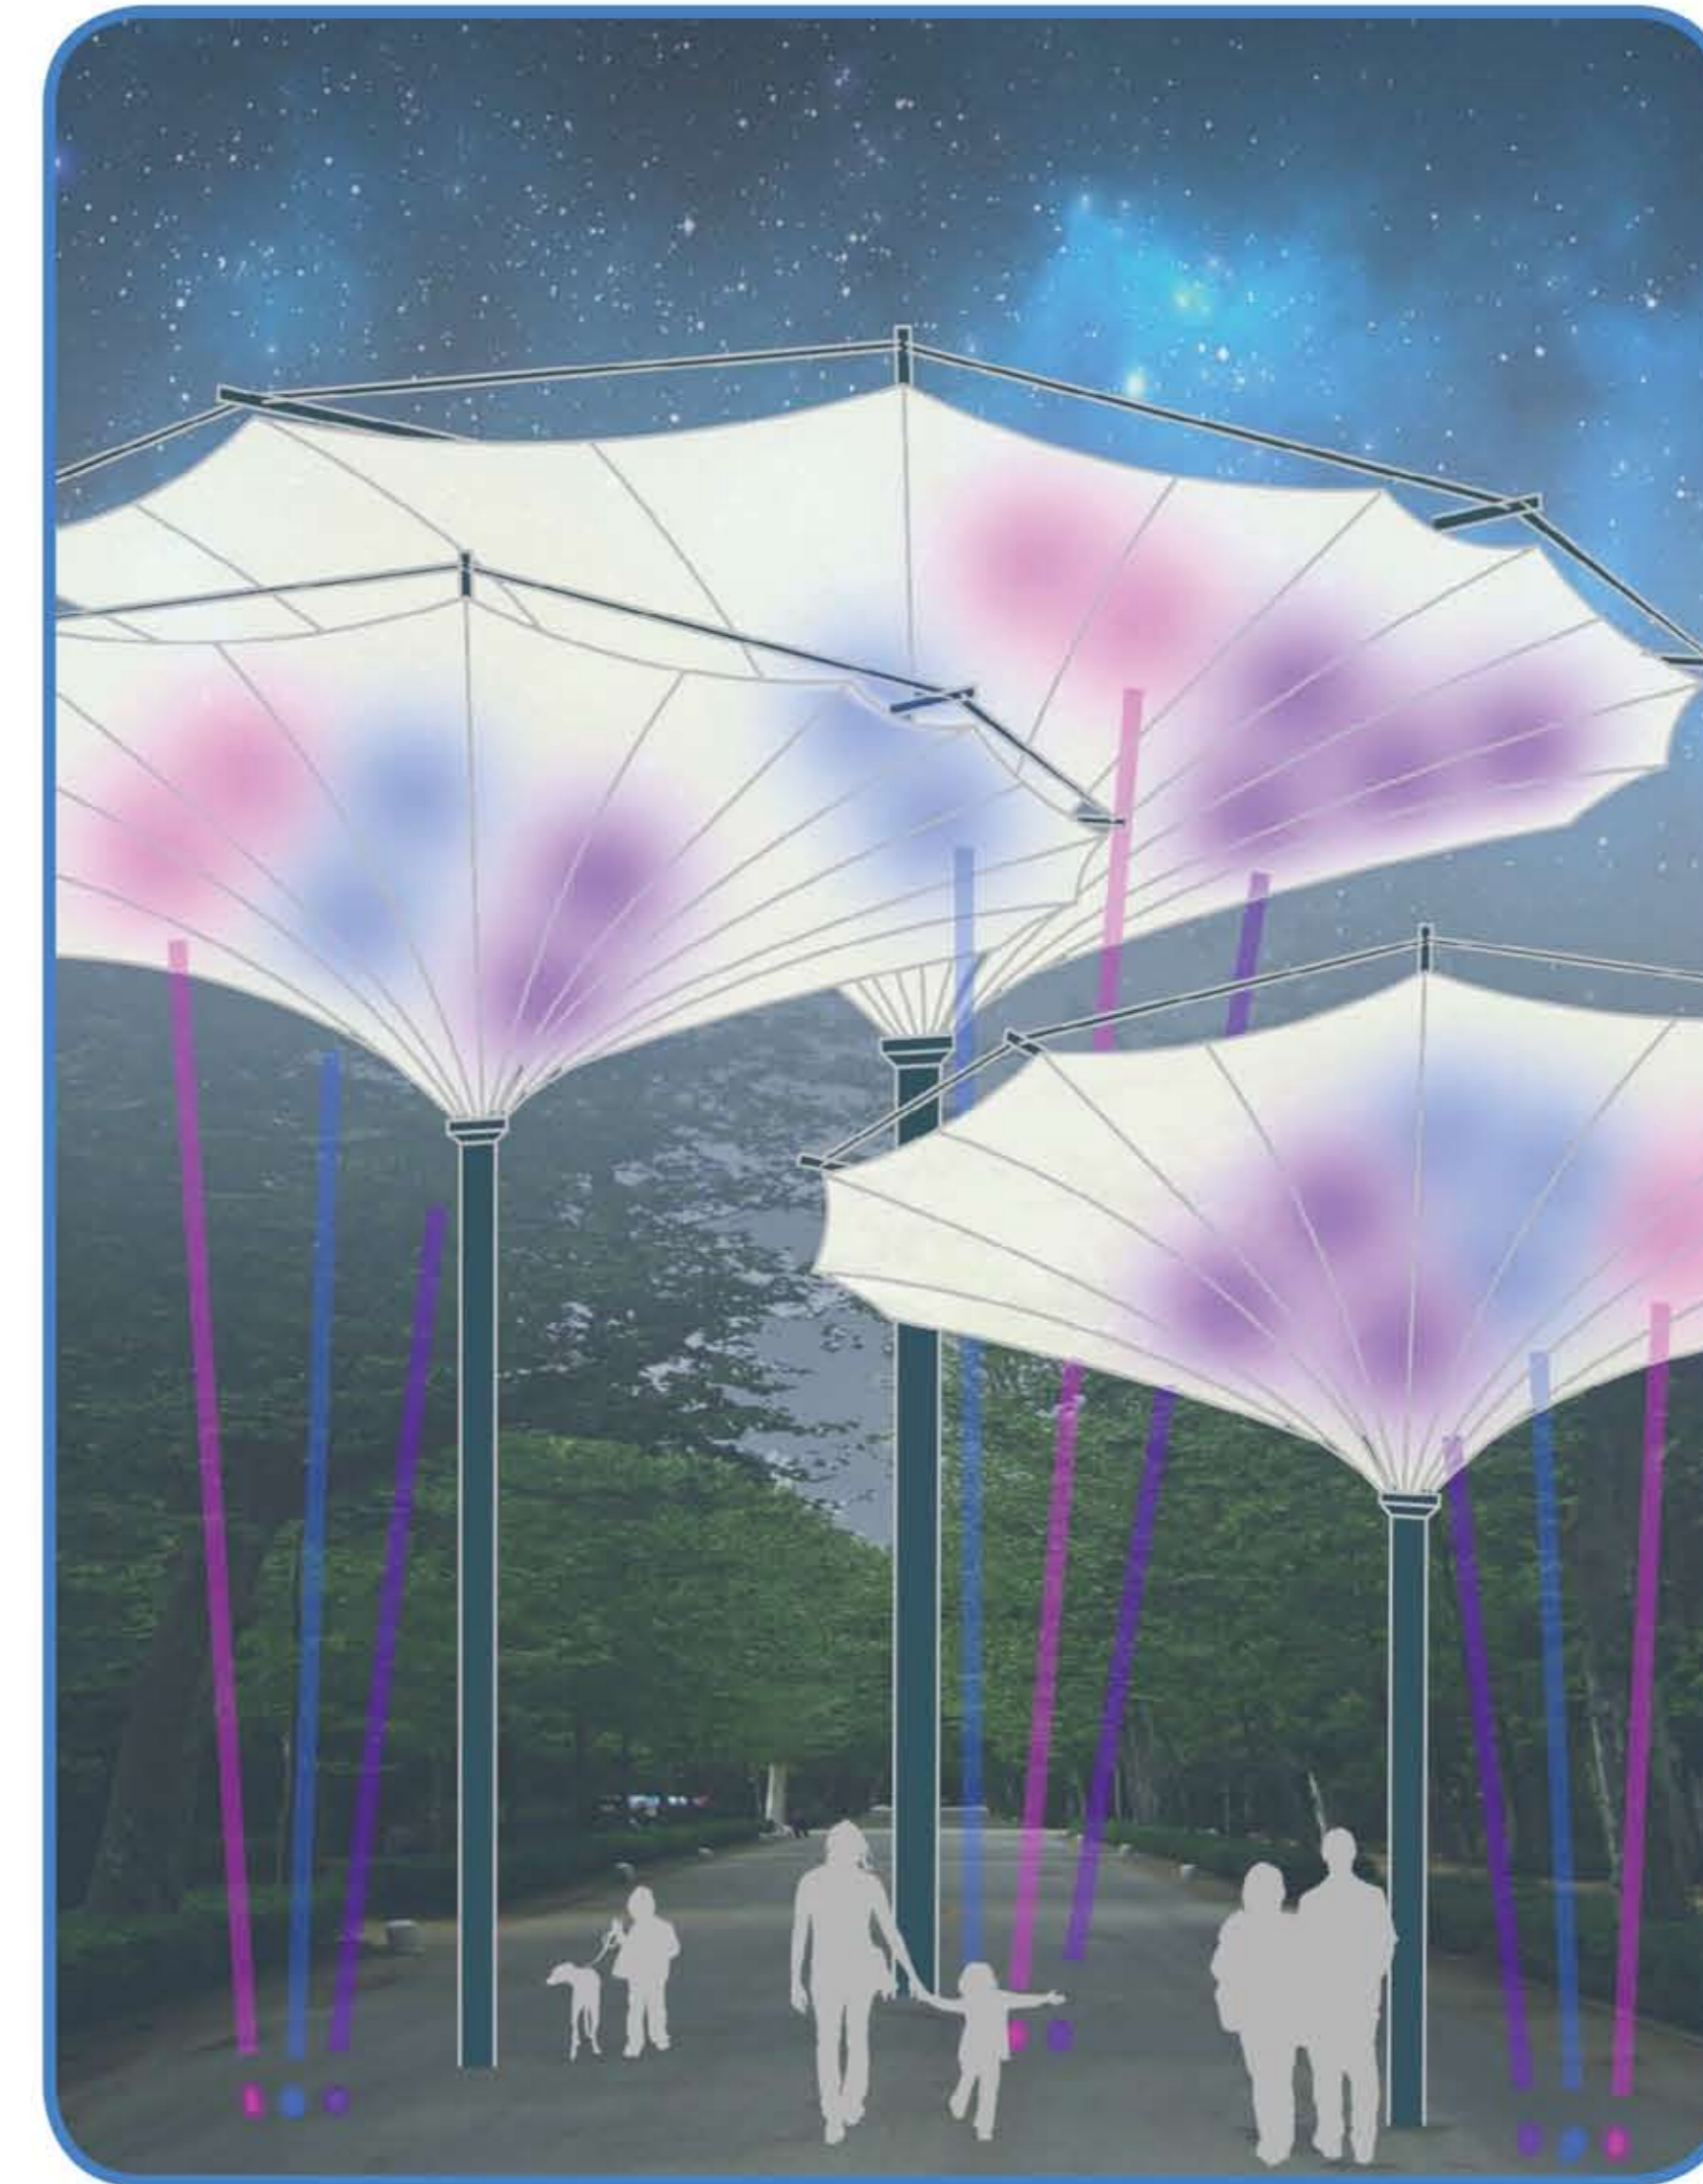

Beyond the ground level display, LED ground lights are designed to project light upward onto fabric canopies above, creating a colorful mosaic of light in the evening sky. All of these lighting events would be programmed by a lighting artist.

Other valued features in the park site include a playground, workout stations, picnic/bbq area, multi-purpose turf space, seat walls, decorative paving and focal points for display of local art.
